

PRODUCT CARD

Site compliance audits

Businesses have the responsibility to ensure that their plant and machinery is maintained, inspected or examined in line with UK health and safety legislation. Failing to correctly manage these risks could have far reaching consequences, leading to physical, financial and reputational losses.

Dependant on the size of a given location, identifying all plant and equipment can be a straightforward process, but as property/portfolio sizes increase, the complexity of the identification of this equipment also increases.

How we can help

When a customer takes on new properties or complete portfolios, or wants to review their current equipment estate, we can visit the site(s) and create a detailed report of plant and equipment which should be inspected in line with the relevant regulations.

In order to help with managing these items, our knowledgeable, and competent engineers can attend site, to work with our customers' to discuss and identify plant and equipment which should be examined under the following regulations:

- Control of Substances Hazardous to Health 2002 (COSHH)
- Lifting Operations and Lifting Equipment Regulations 1998 (LOLER)
- Provision and Use of Work Equipment Regulations 1998 (PUWER)
- Pressure Systems Safety Regulations 2000 (PSSR)
- Work at Height Regulations 2005 (WAHR)
- Current and relevant industry/ HSE related guidance.

As part of the site visit we discuss any site specific advice relating to inspections, access issues and identify appropriate site contacts.

Our customers may use this service to perform a gap analysis against their known assets and those which we are already contracted to inspect. This service can also help when transitioning to Allianz Engineering as your new inspection provider. Site compliance audits can also help with internal housekeeping, maintaining compliance or when considering combining inspection from multiple providers to just one single provider.
